DOC-16: Industry Configuration & Extensibility Framework

Version: 1.0 | **Status:** APPROVED | **Date:** 2026-08-27 **Purpose:** Architecture for industry-agnostic business modules. **Owner:** Senior Software Architect

Extensibility Principle

The platform must support multiple industries (Jute, Textile, Garments, SMEs) WITHOUT hardcoding industry-specific logic. **DO NOT use patterns like:** `if (industry == 'jute')`

Configuration over Hardcoding

- **Custom Fields:** Entities like Product can be extended with Custom Fields (e.g., Jute might need 'Grade', 'Moisture'; Textile needs 'GSM', 'Fabric Type').
- **Dictionaries/Metadata:** Units, Material Types, Categories, Statuses, and Tax rules must be configuration-driven, stored in DB or tenant settings.
- **Workflows:** Approval routing and validations should be configurable via settings or a rules engine.

Future Architecture Layering

- **Core Platform:** Auth, Tenant, Settings.
- **Module System:** Inventory, Purchase, Warehouse (generic abstractions).
- **Industry Layer:** Jute, Textile plugins or templates that seed custom fields and predefined workflows on top of the Module System.
