DOC-18: Notification Architecture

Version: 1.0 | **Status:** APPROVED | **Date:** 2026-08-27 **Purpose:** System and user notification design. **Owner:** Senior Software Architect

Notification Types

- **Severity:** INFO, SUCCESS, WARNING, ERROR.
- **Entities:** In-App (MVP), Email, SMS (Future), Push (Future).

Event-Driven Design

Business modules trigger generic events (e.g., UserCreatedEvent, StockLowEvent). Notification Listeners pick these up to generate standard notifications. This prevents tight coupling between business logic and the notification service.

Data Model

- id, organization_id, user_id, type, title, message, data (JSONB for variable metadata), read_at, created_at.
- **UI UX:** Notification Bell (Unread count), Dropdown list (Mark as read, Mark all as read), Dedicated Notification Center page.
